

Meeting: Product Vision Workshop #1

Document Information:

Project:	TravelMate
Document:	Discovery Summary
Version:	v1.0
Author(s):	Vu Tran Minh Ngoc
Date:	30/06/2026
Status:	Draft

Revision History:

Version	Date	Author	Changes
v1.0	30/06/2026	Vu Tran Minh Ngoc	Initial Draft
v1.1	02/07/2026	Vu Tran Minh Ngoc	Updated Business Goal after stakeholder review

Attendees	CEO, PO, Marketing, Tech Lead, BA
Business Problem	Current travel planning is fragmented across multiple applications, resulting in poor collaboration and inconsistent trip information. This fragmented experience reduces user engagement and allows competitors with more integrated solutions to gain market advantage.
Key findings	• Primary target age group: 25–34 years old (49% of respondents) • Occupations: Office workers, freelancers, couples, and groups of friends, travelling approximately 2–4 times per year • Travel behavior: 72% travel in groups, while 28% travel alone • Pain points occur across all stages of the travel journey: before, during, and after the trip
User Insights	Users rely on multiple applications to manage itineraries, expenses, and communication. As a result, they frequently lose track of the latest information, duplicate work, and experience difficulties collaborating with other travelers.
Stakeholder Alignment Challenges	Stakeholders have different priorities regarding AI. • CEO: Prioritizes AI to increase investor attractiveness. • Marketing: User research indicates low customer demand for AI (18%). • Product Manager: Prioritizes faster MVP delivery and collaboration features. • Tech Lead: AI requires significant implementation effort and may delay the release.

Open Questions	• Should AI be included in the MVP or deferred to a later release? • What is the primary success metric for the MVP? • Which collaboration features should be included in the first release? • How should investor expectations be balanced with user research findings? • What is the maximum acceptable timeline for the MVP release?
Recommendations	Based on current user research, collaboration-related challenges affect significantly more users than AI-related needs (over 70% vs. 18%). Therefore, collaboration features are likely to provide greater immediate value for the MVP. However, the final prioritization should be aligned with business strategy, investment objectives, and product roadmap.
Next Actions	• Finalize the MVP scope with key stakeholders. • Prioritize collaboration-related features for Sprint Planning. • Conduct additional discussions regarding AI prioritization. • Prepare Business Requirements for the agreed MVP scope. • Schedule the next Product Discovery Workshop.s
